CONCISE DESCRIPTION OF RELEVANCE OF REFERENCE

U.S. Patent 6,061,316 discloses that a track scanning position is changed at both the recording and reproduction for test data. However, the "optimum value of an output value of the laser beam" in the reference is quite different from the "evaluation of the recording condition" in the present invention. The "optimum value of an output value of the laser beam" in the reference as shown in Fig. 7(b) means that data is written in a track formed on land portion 15 in the test area while the output value of laser is being changed on the track, data is reproduced from the track formed on adjacent groove portion 16, and an optimum output value of the recording laser is obtained, so that a mark width may be detected by using a reproduction level which was used for reproducing the mark width from the adjacent track, referring to the description on col. 6, line 59 to col. 7, line 9, referring also to Figs. 7 and 4. However, in the case of the "optimum value of an output value of the laser beam" in the reference, the reference only assumes a mark width extrusion amount in view of the adjacent track, but does not assume that both a mark width of the on-track and a mark interval between adjacent tracks are controlled in the present invention.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it contains a valid OMB control number.
